- 3.1.3. comparison between study #2.1. and study 2.2
- 3.1.4. influence of time spent reading the guide and study #2.2

3.5. perception towards consumption frequency

- 3.1.1. comparison between study #1 and study #2.1 (guide not received)
- 3.1.2. comparison between study #1 and study #2.2 (guide received)
- 3.1.3. comparison between study #2.1. and study 2.2
- 3.1.4. influence of reading time on study #2.2
- 3.1.5. comparison between study #1, study #2.1 and study #2.2 (read more than 5 minutes)

1. introduction

introducción

1.1. objetivos

- Analysing the use of animals, attitudes toward vegetarianism and veganism, animal products consumption behaviour, and intentions of eating vegetarian and vegan by university students in UK.
- Study the impact or effectiveness of vegan guides on habits, attitudes and intentions of colleagues students in UK.
- *Both objectives are especially focused on the population of female students (TO DO or pending)*

1.2. methodology

This search has followed a **quasi-experimental approach**, given that the purpose of it was to examine the causal effect of the vegan guide (stimulus) on multiple variables, mainly behaviour, attitudes, and intentions.

For that goal, **participants were recruited randomly** on campus and asked **to complete a paper-and-pencil questionnaire** in two different moments: before and after the distribution of the vegan guide on campus.

To analyse the impact of the guide, **two specific control groups** were included in this study: first group integrated by those subjects who answered the questionnaire before the distribution of the guide (study #1); second group integrated by those participants who answered the questionnaire after the distribution of the guide but expressed that did not received it (study #2.1).

Additionally, we included a variable control: time spent on reading the guide

According to the objectives of the study, a quantitative methodology was adopted.

- *Geographic unit: ???*
- *Time Unit:???*
 - study #1:
 - study #2:
- *Subjects Unit:* university students
- *Universe and Sample:* the university population is considered as a single population. Given that the main objective of this exploratory research was to study the vegan guide impact of the vegan guide on campus, a convenience and maximum variability technique was used. The valid sample is conformed by 370 students (study #1) and 493 student (study #2).

1.3. questionnaire (a copy of it can be found in Annex)

- sociodemographic variables: gender, age, political ideology and religion (only in study #1), university major, and educational level
- attitudes towards the use of animals (only in study #1)
- consumption habits in the last 2 years and last 2 month (study #1 and study #2, respectively)
- perception of consumption in the last month compared to last year
- reasons for the change of habits
- miscellaneous: willingness to consume vegetarian option at campus, knowledge in animal welfare, interest in animal welfare issues, interest in vegetarianism, interest in veganism.
- attitudes toward vegetarianism (only study #1) and veganism
- willingness to eat vegetarian and vegan, to reduce animal products consumption (meat, fish, shellfish, eggs, and dairy) in the next 12 months
- guide reception, guide influence and time expended on reading the guide.

1.4. phases

- **literature review phase.** construction of the theoretical framework and operationalisation of variables.
- **fieldwork phase.**
 - Stage 2.1. Designing the surveys
 - Stage 2.2. Recruiting and training volunteers
 - Stage 2.3. Conducting the pre-intervention questionnaires
 - Stage 2.4. Guide distribution
 - Stage 2.5. Conducting the post-intervention questionnaires (one month after the intervention or guide distribution)
- **analysis**
 1. **descriptive analysis**
 2. **inferential analysis:** The group comparisons are made regarding consumption habits, attitudes towards veganism, willingness to eat vegetarian and vegan, and reducing animal products (meat, fish, eggs, and dairy) consumption. Specifically, the group comparison conducted for each variable are:
 - comparison between study #1 and study #2.1 (guide not received)
 - comparison between study #1 and study #2.2 (guide received)
 - comparison between study #2.1 and study 2.2
 - influence of reading time on study #2.2
 - influence of reading the guide more than 5 minutes comparing with study #1 and study #2.1

statistical test

SPSS, v. 21. Nonparametric tests: Man-Whitney U test, and Krustall Wallis (with Bonferroni post-hoc test).

scale reliability (alpha de Cronbach)

1. use of animals: 0.82
3. behavior during last year: 0.76
4. interest on animal welfare, vegetarianism, o and veganism: 0.76
5. willingness to eat vegetarian, to eat vegan, to reduce meat and fish consumption: 0.84
6. attitudes towards vegetarianism: 0.87
7. attitudes towards veganism: 0.81
8. behavior during last month: 0.65
8. perceptions towards change of frequency on consumption: 0.71

2. descriptive analysis

análisis descriptivo

En este primer bloque se realiza **un análisis descriptivo de toda la muestra**. Para ello, se han diferenciado cinco apartados que se corresponden con:

1.1. las variables sociodemográficas

pág. 9

se muestra la distribución de los casos a partir del sexo, edad, estilo de vida y alimentación, niveles educativos y carreras.

1.1.1. an overview: comparative between study #1 and study #2 (differentiating between people who received the guide and who did not, hereafter study #2.1. to and study #2.2. respectively)

1.1.2. detailed:

1.2. la recepción de la guía

pág. 12

en este apartado se exponen los porcentajes de las personas que recibieron y no recibieron la guía, distribución del tiempo dedicado a su lectura y la valoración de la influencia de la guía por los estudiantes universitarios.

1.3. los hábitos de consumo

pág. 16

en esta sección se presentan los análisis relativos a las preguntas sobre hábitos de consumo de los estudiantes universitarios del último mes y la comparación de los hábitos del último mes con el último año. Finalmente se muestra la valoración de las razones principales del cambio de hábitos de consumo alegadas por los estudiantes

1.4. las intenciones de los estudiantes

pág. 26

en esta sección se muestran los datos respecto a la intención de los estudiantes de adoptar el veg(etari)anismo y de reducir el consumo de los productos animales (carne, pescado, huevo, lácteos)

1.5. las actitudes hacia el vegetarianismo

pág. 30

este último apartado cierra con los datos relacionados a la valoración del vegetarianismo por parte de los encuestados

2.1. sociodemographics

SEXO

La muestra, coincidiendo con los objetivos planteados en el estudio, está compuesta mayoritariamente por mujeres (68.3%). Este porcentaje supera la media nacional que se sitúa en 54.3% (Ministerio de Educación, Cultura y Deporte, 2013)* pero se aproxima a la media en las carreras de Ciencias Sociales y Ciencias de la Salud donde las mujeres representan el 61.1% y el 70.5% de la población universitaria.

EDAD y NIVEL DE ESTUDIOS

La edad media de los estudiantes es de 21.5 años. En relación a la población universitaria, nuestra muestra es más joven, siendo el 92.2% menor de 26 años. Lo podemos ver en la siguiente tabla donde aparecen los datos del Ministerio de Educación (2013)* y los relativos a nuestro estudio. Esta distribución de edad conlleva a una infrarepresentación de niveles superiores de estudio (máster y doctorados).

	población general	nuestro estudio
entre 18 y 21 años,	40,6%	57,4%
22 a 25 años	27,7%	34,8%
de 26 años o más	31,7%	8,1%

ESTILO DE VIDA/ALIMENTACIÓN

Entre los encuestados, sólo un 2.6% y 1% es, respectivamente, vegetariano y vegano. Aunque en España no se tienen cifras oficiales del número de veg(etari)anos, si tomamos como referencia los datos de Vegetarian Research Group, los vegetarianos estarían infra-representados en nuestra muestra. No obstante, ello no es un problema para este estudio, cuyo objetivo principal es analizar la influencia de la guía en los no vegetarianos. Ello explica que los análisis posteriores se realicen excluyendo a los vegetarianos y los veganos.

Dejando a parte los estudiantes que se consideran veg(etari)anos/as, 108 encuestados declararon que no consumían ciertos animales o productos de los animales y que seguían sin consumirlos en el momento de realización de la encuesta.

Por orden (de mayor a menor) se encuentra: marisco (11.9%), cerdo (3.3%), ternera (2.9), pescado (2.3 %), pollo (2%), lácteos (0.7%) y huevos (0.3%). Cuando se analizan las razones alegadas por estos sujetos para no consumir dichos animales/productos, resulta que “la salud” aparece en el discurso del 47.1% de los estudiantes, “los animales” en el del 16.7% y “el medioambiente” en el del 2.8% de los entrevistados. Asimismo, el 39.4% señala “otras razones”, entre las que se encuentran las económicas (por comentarios que realizaron los encuestados).

CARRERAS

Una de las limitaciones de la muestra se refiere a la falta de representación de las distintas carreras existentes en el campus de Somosaguas. Esto es, los estudiantes encuestados cursan principalmente cuatro carreras: psicología, económicas, empresariales y políticas. Si partimos de que la preocupación e interés hacia la protección animal pudiera estar influida por las carreras o las disciplinas que se estudian, la sobrerrepresentación de estudiantes de las especialidades de ciencias económicas podrían distorsionar los resultados generales. Asimismo, la falta de diversidad entre ellas no nos permiten hacer análisis comparativos entre todas las carreras existentes en dicho campus.

Recomendación: en próximos trabajos convendría que la muestra de las distintas carreras fuera equivalente si se estima relevante examinar dicha variable para futuras campañas de concienciación.

2.2. guide reception

PERSONAS QUE RECIBIERON LA GUÍA

Aproximadamente, la mitad de los encuestados recibieron la guía repartida en la Universidad. Por otra parte, sólo un 4% de los que no la recibieron declararon saber sobre su existencia, aunque se desconoce los medios a través del cual la conocieron (ej. comentarios de amigos, visualización directa, etc).

TIEMPO DEDICADO A LA GUÍA

Siendo la media del tiempo dedicado a la guía 2.9 (en una escala de 4 puntos, donde 1 era no lo miró/lo tiró y el 4 más de 5 minutos) podemos concluir que el tiempo medio dedicado por los estudiantes a la guía fue entre 1 y 5 minutos. Por otra parte, los resultados indican que casi un 10% la ignoró y casi un 30% le dedicó más de 5 minutos.

GRUPOS DE CONTROL

La importancia de estos dos indicadores, personas que recibieron (o no) la guía y el tiempo dedicado a la misma, les viene porque servirán como variables de control para medir la influencia de la guía en el cambio de hábitos, intenciones y actitudes declaradas por los estudiantes. No obstante, cabe recordar que los resultados mostrados en esta sección son sobre la muestra total (N= 769) y que análisis posteriores se realizarán sobre la base de datos resultante de haber eliminado veg(etari)anos y/o casos dudosos (no estar seguros de que recibieran o no la guía o del tiempo que le dedicaron) (N=753).

VALORACIÓN DE LA INFLUENCIA DE LA GUÍA POR LOS ESTUDIANTES (pregunta 13 y 14)

Cuando se trata de la valoración, por parte de los estudiantes, de la influencia que la guía ha tenido en sus hábitos cabe tener presente que nos encontramos ante una variable subjetiva; no sólo se trata de una percepción personal acerca de la influencia que ha tenido sino que además lo que para una persona puede valorar como “mucha” influencia para otra puede ser “poca” influencia.

Independientemente de la subjetividad de la cuestión, la mitad de los estudiantes que recibieron la guía y no la tiraron consideran que la guía ha impactado en sus hábitos de consumo. A estos resultados nos conducen el análisis de dos preguntas diferentes:

- la pregunta 13: cuando directamente se les pide que valoren la influencia que la guía ha tenido en sus hábitos de consumo, en cuyo caso el 50.1% de los que la recibieron y no la tiraron (N= 365) señalan haberle influido: 1.9% dice haberle influido mucho, un 7.7% bastante y un 40.3% un poco.
- la pregunta 14: cuando se les pide que valoren las razones de su cambio también se les da la opción de elegir la respuesta de que sus “hábitos no han cambiado” y en este caso el 49.7% señala que sus hábitos no han cambiado.

No obstante, dada las limitaciones de la pregunta, estos resultados han de adoptarse con cierta cautela; el análisis estadístico inferencial, que compara los estudiantes que recibieron la guía con los grupos de control, arrojará más luz sobre la influencia de la guía en los hábitos de consumo y hasta qué punto se corresponde con la percepción de los estudiantes.

RAZONES DETRÁS DEL CAMBIO

Para aquellos que dijeron que la guía les había influido (un poco al menos) la principal razón para cambiar sus hábitos fueron “los animales”. Concretamente, para el 31% de dicha muestra los animales han influido mucho o totalmente. Así, resulta que en la escala de 5 puntos (1 ninguna influencia y 5 totalmente) los animales hayan obtenido una media de 3.4.

En segundo lugar se encuentra “la salud”, razón importante para el 27% de la muestra y con una media del 2.7. Finalmente, y no muy lejos de la salud, se encuentra la opción “el reducir el consumo de carne es más fácil de lo que pensaba”, cuya influencia parece ser decisiva para el casi 20% de los estudiantes y con una puntuación media de 2.5. Por último señalar que el 0,5% señaló haberle influido la guía pero por otras razones no contempladas en el cuestionario.

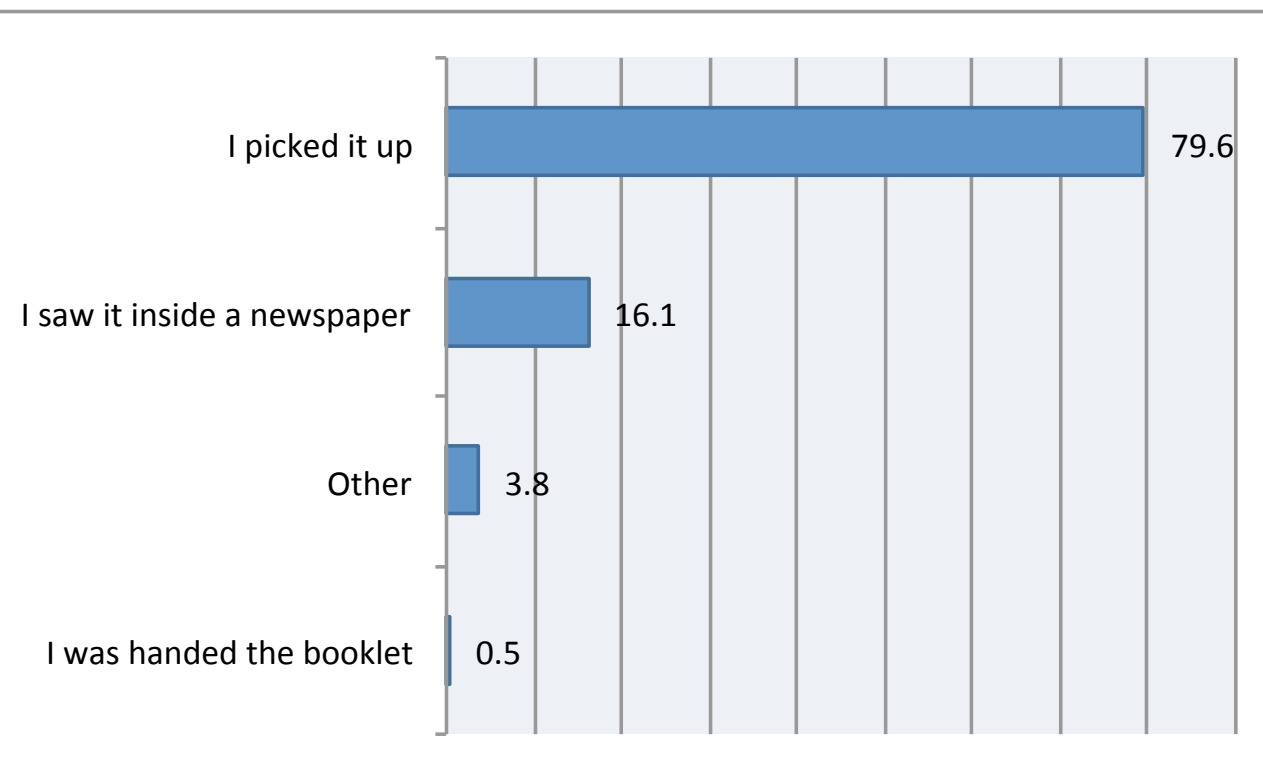

STUDY #2

In the last few weeks have you read the following booklet?

	n
YES	211
NO	282

If you read the booklet, how or where did you see the booklet? (n=211)

If you read the booklet, approximately how much time did you dedicate to reading it? (n=211)

If you have read the booklet, to what extent do you think it has influenced a change in your eating habits? (n=183)

STUDY #2

After reading the booklet, what do you believe has influenced you more to positively change your eating habits?

Health (n=110)

Higher values of the MEAN indicate more negative attitudes toward the use of animals and therefore more favorable for animals.

visual representation of MEAN

Animals (n=111)

Eating less meat is easier than I thought (N=108)

STUDY #2

Breed animals to sell as pets (n=365)

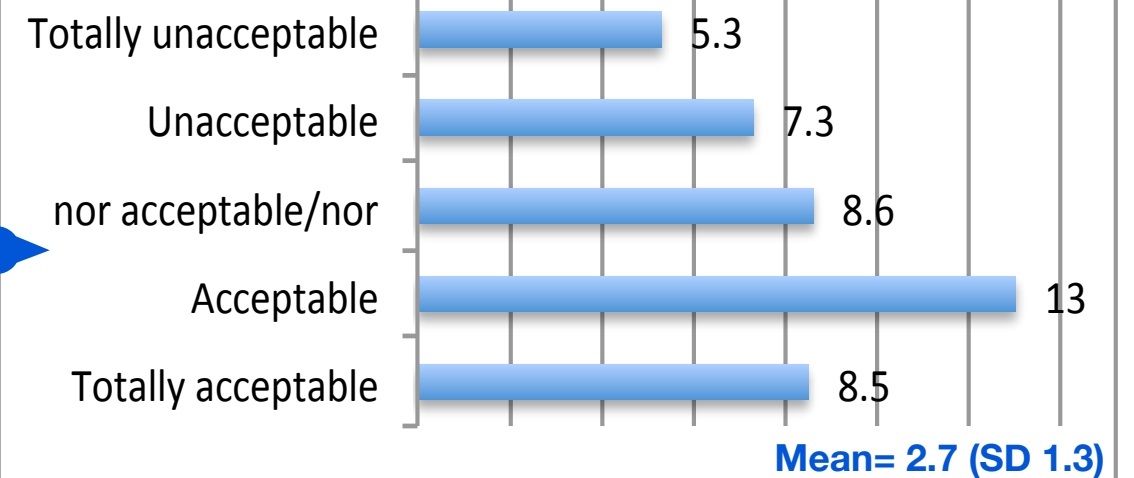

Use animals in sports (hunting, dog racing, etc.)

Experiment on animals to test cosmetic

Experiment on animals for medical research

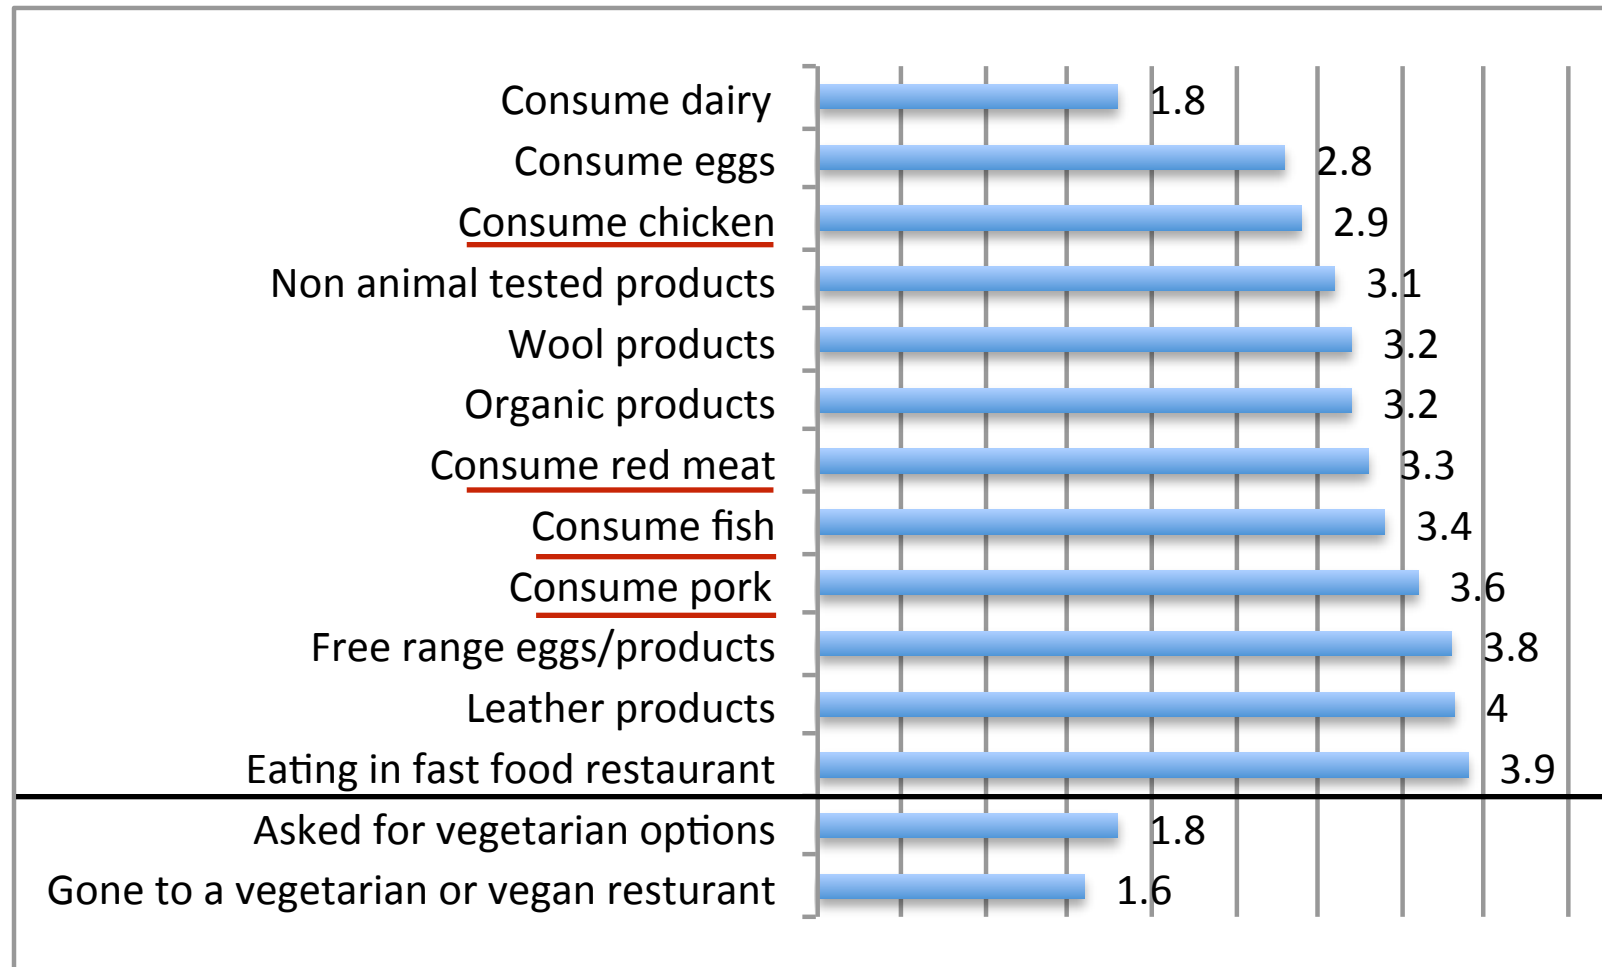

2.4. past 2 years behavior

STUDY #1

Please indicate in the last 2 years, how many times you have:

Behavior frequency (Mean)

Higher values of the Mean are more positive for animals: less consumption of that animal/animal product and more consumption of veg* options or visit to veg* restaurants.

Likert Scale

- 1 Everyday
- 2 Several times a week
- 3 Once a week
- 4 Once a month
- 5 Never

STUDY #1

Please indicate in the last 2 years, how many times you have:

fast food

eaten at the cafeteria on campus

Asked for vegetarian/vegan options in restaurants

Gone to a vegetarian or vegan restaurant

STUDY #1

Please indicate in the last 2 years, how many times you have:

Consumed fish

Consumed pork

Consumed chicken

Consumed red meat

STUDY #1

Please indicate in the last 2 years, how many times you have:

Consumed eggs (%)

Mean= 1.8 (SD 1.1)

Consumed dairy (%)

Mean= 1.6 (SD 0.6)

Not consumption of animals/animal products and lifestyles

	%	n
Do not consume fish*	3,8	14
Do not consume pork*	10,1	37
Do not consume chicken*	3,5	13
Do not consume red meat*	6,0	22
Do not consume eggs*	3,8	14
Do not consume dairy*	1,6	6
Do not consume fish, pork, chicken or red meat (vegetarians)**	7,6	28
Pescatarians (do not eat pork, chicken or red meat, but eat fish)	3,3	12
Dietitian vegan (do not eat any flesh, neither milk or eggs)	2,7	10
Ethic vegan (vegan diet and never buy leather nor wool)	0,8	3

*Excludes vegetarians and vegans; **excludes vegans

Around 8%, and 3% of the sample could be denominated, respectively, as vegetarians and pescaterians. Around 3% of the sample could be considered as 'dietitian vegan'; whereas only 0.8% could be considered 'ethical vegan' because never buy leather or wool. However it is important to note that most of dietitian vegan only buy leather or wool once a year.

If you do not consume any animal products mentioned, which is the main reason why? (n=46)

2.5. miscellaneous variables

STUDY #1

If your university were to include vegetarian/vegan options in the cafeteria, how many times would you consume them?

Higher values of the MEAN are more positive for animals

Please indicate your: Knowledge in animal welfare

Higher values of the MEAN are more positive for animals

STUDY #1

Please indicate your interest in animal welfare issues

Higher values of the MEAN are more positive for animals

Please indicate your interest in vegetarianism

Please indicate your interest in veganism

Higher values of the MEAN are more positive for animals

2.6. attitudes toward veg(etari)anism

En esta sección analizamos las actitudes de los estudiantes hacia el vegetarianismo, bajo la premisa de que actitudes positivas conllevarán a una mayor adopción del vegetarianismo.

En lo que respecta a este estudio, y basándonos en la literatura existente, las actitudes se midieron a través de adjetivos positivos y negativos.

Antes de pasar al análisis de estos adjetivos, lo primero que llama la atención es que los estudiantes no tienen una valoración muy formada respecto al vegetarianismo. A esta conclusión se llega tras analizar **la valoración media de los distintos atributos**; esto es, en la mayoría de los casos la media está alrededor del 3 (en una escala de Likert de 5 puntos) que indica “ni de acuerdo ni en desacuerdo”. Ahora bien, según la literatura, esto no es necesariamente malo o negativo en lo que al cambio de comportamientos pro-animalista se refiere. La ambivalencia, término con el que se denomina en la literatura a esta falta de opinión formada, denota una ausencia de reflexión, de conocimiento y de opiniones robustas formadas por parte del sujeto hacia el fenómeno en cuestión. Esta ambivalencia está indicando un segmento indeciso y, por lo tanto, abierto a cambiar de postura o de opinión. Futuras campañas podrían centrarse en disminuir dicha ambivalencia y aumentar las actitudes positivas hacia el vegetarianismo de dichos sujetos, que en nuestro caso comprende casi el 30% de los encuestados.

ACTITUDES: ADJETIVOS POSITIVOS

En lo que se refiere a los adjetivos positivos, si analizamos por separado cada uno de los atributos, observamos que la cualidad más ampliamente extendida entre los estudiantes hacia el vegetarianismo es la de ser “ético”, adjetivo plausible para más del 50% de los encuestados. Asimismo, aunque en menor medida (alrededor de un 30% de los participantes) consideran que el vegetarianismo es natural, sano y bueno.

En cambio, con la que están menos de acuerdo es con que el vegetarianismo sea “fácil”, condición que aprueba sólo el 11% de los participantes. Esto es muy importante, especialmente si lo ponemos en relación con las intenciones declaradas de los sujetos de adoptar el vegetarianismo en el próximo año. Dada que la falta de conveniencia es una de las barreras más importantes observadas en comportamientos éticos en general, y en el vegetarianismo en particular, se recomienda que futuras campañas tengan en cuenta dicha valoración y se enfoquen o resalten la viabilidad y sencillez de adoptar un estilo de vida vegetariano (ej. recetas, charlas, talleres de cocina).

ACTITUDES: ADJETIVOS NEGATIVOS

Respecto a los adjetivos negativos relacionados con el vegetarianismo, el más compartido por los estudiantes es que se considere “restrictivo” y “caro”, atributos asignados por aproximadamente el 50% de los encuestados. Asimismo, aunque en menor medida, se considera que el vegetarianismo es “extremo” (casi el 35%) y “aburrido” (casi el 29%). En cualquier caso, el porcentaje de personas que consideran que el vegetarianismo es “hipócrita” es reducido; concretamente, sólo el 12% de los participantes estaban de acuerdo (o muy de acuerdo) con dicha expresión. (*mirar Iso resultados de Povey*).

Estos resultados sugieren que un gran número de estudiantes consideran que el vegetarianismo es un comportamiento ético y consecuente, no obstante existen barreras importantes como la dificultad, la falta de alternativas y la onerosidad que pueden actuar como importantes frenos a la hora de intentar abrazarlo.

attitudes towards vegetarianism (study #1)

POSITIVE ATTRIBUTES

To your knowledge, do you think being **VEGETARIAN** is:

2.7. willingness

En esta sección se analiza las intenciones de los estudiantes de cambiar determinados hábitos. La importancia de estudiar las intenciones le viene porque según numerosas investigaciones sobre el comportamiento humano, la intención es la variable con mayor poder predictivo del comportamiento y cambio del mismo.

En lo que respecta a este estudio, el cuestionario incluía dos grandes grupos de intenciones: la intención de ser vegetariano y de ser vegano en el próximo año; y la intención de reducir el consumo de animales y/o productos de origen animal.

INTENCIÓN DE SER VEG(ETARI)ANO

Cuando analizamos la muestra total de los estudiantes, tanto los que recibieron la guía como los que no, resulta que el 10% de los estudiantes tiene la intención de hacerse vegetariano en el próximo año. En cambio, sólo el 5.1% tiene la intención de ser vegano en el mismo periodo de tiempo. Esta diferencia es importante y ha de tenerse en cuenta a la hora de diseñar futuras campañas.

(¿está en línea con la opinión que tienen los estudiantes respecto a ambas opciones? comparar con mi tesina y con los resultados de UK)

INTENCIÓN DE REDUCIR EL CONSUMO DE ANIMALES y PRODUCTOS ANIMALES

Comparado con la intención de adoptar el veg(etari)anismo, las cifras son más altas cuando se trata de la intención declarada de reducir el consumo de animales y productos animales. Así, como muestran las gráficas de este apartado, más del 25% de los encuestados expresa tener la intención de reducir el consumo de carne aunque menos del 10% tiene la intención de reducir el pescado. En lo que respecta a los productos animales, el porcentaje de sujetos que tienen la intención de reducir el consumo de lácteos es similar al de reducir el consumo de huevos, el 11.3 % y el 10.2% respectivamente.

Unos de los problemas con que nos encontramos en esta pregunta es el propio concepto de reducción. A diferencia de las preguntas sobre vegetarianismo o veganismo en las que se definían ambos términos, las opciones de reducción se dejaban a la libre interpretación de los encuestados, con lo que es difícil estimar en qué cantidad consideraban que reducirían su consumo en el tiempo establecido.

En cualquier caso, los valores referentes a la intención son positivos, especialmente en lo que se refiere a la carne. Si bien, siguiendo los patrones hasta ahora observados respecto a las razones que motivan el comportamiento, se puede conjeturar que la reducción afectara principalmente al cerdo y a la ternera, a los lácteos más que a los huevos. Asimismo, cabría pensar que la salud fuera la razón más importante detrás de dichas intenciones.

STUDY #1

Please indicate to what level do you agree
with the following options

OVERVIEW: MEAN

Higher values of the **MEAN** are more positive for animals: greater intention to eat vegetarian/vegan and to reduce meat/fish consumption

Likert Scale

- 1 Strongly Agree
- 2 Agree
- 3 Nor Agree/
NorDisagreee
- 4 Disagree
- 5 Strongly Disagree

STUDY #1

Please indicate to what level do you agree with the following options

I intend to eat **VEGETARIAN** in the next 12 months

I intend to eat **VEGAN** in the next 12 months

I intend to **REDUCE** my **MEAT** consumption in the next 12 months (%)

I intend to **REDUCE** my **FISH** consumption in the next 12 months (%)

STUDY #2

Please indicate to what level do you agree
with the following options

OVERVIEW: MEAN

Higher values of the MEAN are more
positive for animals: greater intention to
eat vegetarian/vegan and to reduce meat/
fish consumption

Likert Scale

- 1 Strongly Agree
- 2 Agree
- 3 Nor Agree/
NorDisagree
- 4 Disagree
- 5 Strongly Disagree

STUDY #2

Please indicate to what level do you agree with the following options: “I INTENT TO...”

eat VEGETARIAN (next 12 months) (%)

eat VEGAN (next 12 months) (%)

REDUCE my MEAT consumption (next 12 months)

REDUCE my FISH consumption (next 12 months)

Please indicate to what level do you agree with the following options

REDUCE my EGG consumption (next 12 months)

REDUCE my DAIRY consumption (next 12 months)

3. inferential analysis

behavior

IMPACT ON BEHAVIOR: study #1, study #2.1, study #2.2

study #1
VS
study #2.1

Differences are very significant only regarding TWO behaviors (greater values on study #1):

1. gone to veg(etari)an restaurant***
2. asked for veg(etari)an option***
3. consumption of chicken*

study #1
VS
study #2.2

Differences are very significant only regarding TWO behavior (greater values on study #1):

1. gone to veg(etari)an restaurant***
2. eating in fast food restaurants*

study #2.1
VS
study #2.2

Differences are very significant regarding THREE behaviors (greater values on study #2.2):

1. consumption of pork**
2. asked for veg(etari)an options***
3. gone to veg(etari)an restaurants*

conclusion: the guide did not have a significant impact on behavior

*p<0.5; **p<.01; ***p<.001

IMPACT ON BEHAVIOR: time spent reading the guide

Didn't open the booklet/Threw it away VS Less than a minute	NO
Didn't open the booklet/Threw it away VS Between 1-5min.	NO
Didn't open the booklet/Threw it away VS More than 5 min.	SIGNIFICANT DIFFERENCES 1. consumption of chicken*** 2. consumption of red meat**

Less than a minute VS Between 1-5 min.	SIGNIFICANT DIFFERENCES 1. consumption of red meat** 2. gone to veg(etari)an restaurants**
Less than a minute VS More than 5 min.	SIGNIFICANT DIFFERENCES 1. consumption of chicken*** 2. consumption of red meat***
Between 1-5 min. VS More than 5 min.	NO

NO: no significant differences

IMPACT ON BEHAVIOR: time spent reading the guide

study #1 VS More than 5 min.	SIGNIFICANT DIFFERENCES I. Consumption of red meat (less consumption in study #2.2)
study #2 VS More than 5 min.	SIGNIFICANT DIFFERENCES I. Consumption of read meat (less consumption in study #2.2)

attitudes towards veganism

IMPACT ON ATTITUDES: study #1, study #2.1, study #2.2

study #1 VS study #2.1	<p>SIGNIFICANT DIFFERENCES (more positive in study #2.1):</p> <ol style="list-style-type: none"> 1. natural ** 2. expensive** <p>(Interpretation: differences between the samples or bias may explain these differences)</p>
study #1 VS study #2.2	<p>SIGNIFICANT DIFFERENCES (more positive in study #2.2):</p> <ol style="list-style-type: none"> 1. good*** 2. healthy*** 3. ethical** 4. natural***
study #2.1 VS study #2.2	<p>SIGNIFICANT DIFFERENCES (more positive in study #2.2):</p> <ol style="list-style-type: none"> 1. good** 2. boring**

*p<0.5: **p<.01; ***p<.001

**conclusion: the guide had some, but low, impact on attitudes towards veganism
(more impact on positive attributes than negative attributes)**

IMPACT ON ATTITUDES: time spent reading the guide

Didn't open the booklet/Threw it away VS Less than a minute	NO
Didn't open the booklet/Threw it away VS Between 1-5min.	NO
Didn't open the booklet/Threw it away VS More than 5 min.	NO

Less than a minute VS Between 1-5 min.	NO
Less than a minute VS More than 5 min.	NO
Between 1-5 min. VS More than 5 min.	NO

conclusion: the time spent on reading the guide did not had significant impact on changing the attitudes towards veganism

IMPACT ON ATTITUDES: have read the guide more than 5 min.

study #1 VS More than 5 min.	SIGNIFICANT DIFFERENCES 1. boring (more positive attitudes in study #2.2) 2. natural (more positive in study #2.2)
study #2 VS More than 5 min.	SIGNIFICANT DIFFERENCES 1. boring (more positive attitudes in study #2.2)

NO: no significant differences

willingness

IMPACT ON WILLINGNESS: study #1, study #2.1, study #2.2

study #1 VS study #2.1	SIGNIFICANT DIFFERENCES (more positive in study #1): 1. intention to reduce meat consumption*** 2. intention to reduce fish consumption*** 3. intention to eat vegetarian*** 4. eat vegan***
study #1 VS study #2.2	SIGNIFICANT DIFFERENCES 1. intention to eat vegetarian*** 2. intention to eat vegan***
study #2.1 VS study #2.2	SIGNIFICANT DIFFERENCES 1. intention to eat vegetarian** 2. intention to reduce meat consumption 3. intention to reduce egg consumption* 4. intention to reduce dairy consumption**

conclusion: the guide had some impact on willingness to eat vegetarian/vegan and reduce meat, however due to the unexpected differences found between study #1 and study #2.1, the results should take with prudence.

IMPACT ON WILLINGNESS: time spent reading the guide

Didn't open the booklet/Threw it away VS Less than a minute	NO	Less than a minute VS Between 1-5 min.	NO
Didn't open the booklet/Threw it away VS Between 1-5min.	SIGNIFICANT DIFFERENCE: 1. intention to eat vegetarian	Less than a minute VS More than 5 min.	SIGNIFICANT DIFFERENCE: 1. intention to eat vegetarian 2. intention to eat vegan 3. intention to reduce meat
Didn't open the booklet/Threw it away VS More than 5 min.	SIGNIFICANT DIFFERENCE: 1. intention to eat vegetarian 2. intention to eat vegan 3. intention to reduce meat	Between 1-5 min. VS More than 5 min.	NO

IMPACT ON WILLINGNESS: have read the guide more than 5 min.

study #1 VS More than 5 min.	SIGNIFICANT DIFFERENCES 1. reduce meat consumption
study #2 VS More than 5 min.	SIGNIFICANT DIFFERENCES 1. to eat vegetarian 2. to eat vegan 3. to reduce meat consumption 4. to reduce fish consumption 5. to reduce egg consumption

*reduction of egg/dairy consumption was not included in the study #1

possible bias study #2.1 or possible effect of knowing about the guide (although not read)

NO: no significant differences

reasons to change

IMPACT ON PERCEIVED GUIDE INFLUENCE:
study 2.1. and study 2.2. (question not included in study 1)
